FRAME — exoskeleton requirements from motion capture

A folder of Xsens recordings in; one distribution per task type out. Read left to right: the cache in the middle decides whether a change costs hours or seconds.

What a change costs

re-analysis (hours)	an advanced analysis setting (dof_names, ee_segment, trim_*, voxel_m, exo_urdf …), or a corrected height / weight — then only that subject is re-analysed
re-report (seconds)	every key in batch.json, and every figure / table option

`./frame build`	build the image, once
`./frame list`	check the dataset
`./frame run --jobs 6`	analyse + report
`./frame report`	re-report from the cache
